TSCA INFORMATION NOW CURRENT THROUGH JANUARY 18, 2005

Please note that search-term pricing does apply when conducting SmartSELECT searches.

\*\*\*\*\*  
\*  
\* The CA roles and document type information have been removed from \*  
\* the IDE default display format and the ED field has been added, \*  
\* effective March 20, 2005. A new display format, IDERL, is now \*  
\* available and contains the CA role and document type information. \*  
\*  
\*\*\*\*\*

Crossover limits have been increased. See HELP CROSSOVER for details.

Experimental and calculated property data are now available. For more information enter HELP PROP at an arrow prompt in the file or refer to the file summary sheet on the web at:

AB The sheet has (A) an optional under ink receiving layer and (B) a glossy ink receiving layer containing colloidal silica, a hardener, and polymer particles having a substituent reacting with the hardener on the surface. Images are recorded on the sheet by using resin-containing ink. The ink receiving layers (A and B) can be coated simultaneously, and the sheet shows high gloss, ink absorbing rate, and anticracking property.

AB In the printing sheet, a support is coated with or soaked in a solution of silicone-containing vinylpyrrolidone derivative copolymer (A). The processing solution comprises A and water. The ink, containing a dye or a pigment and water, ppts. on the reaction with A, and an ink set comprises ≥2 of the inks. The ink-jet printing method is characterized by (1) using the printing sheet, (2) adhering the processing solution to the sheet before, simultaneously, or after printing by ink. The ink-jet printing apparatus has means for adhering the processing soln. to the sheet. The ink head comprises an ink tank, ink chamber for jetting the ink, heater or piezoelec. element for pressing the ink for jetting, and electrodes for

the element or the heater. Clear, high d. images without bleeding and color contamination are obtained.

AB An ink-jet recording sheet comprises a paper support coated with a polyolefin resin on both sides of the paper support, the polyolefin resin-coated paper support has thereon a porous ink receptive layer containing a hydrophilic polymer, and the paper support has a ratio of a Cobb value to a basis weight of not more than 0.05:1 to 0.4:1. The ink-jet recording sheet can minimize curling under variations of ambient humidity as well as edge wave, and also minimize image problems and rubbing by heads during ink-jet printing.

AB The sheets comprises, on supports, ink-receiving layers containing cationic polymers having quaternary ammonium groups and ethylenic double bonds. The cationic resins may be represented by (A)<sub>m</sub>(B)<sub>n</sub> [A = unit derived from cationic vinyl monomers having quaternary ammonium groups and ethylenic double bonds, B = unit derived from vinyl monomers, m = 20-100 mol%, n = 0-80 mol%, m + n = 100]. Alternatively, the cationic resins are represented by (Q) = unit derived from vinyl monomers having quaternary ammonium groups; R = H, Me; Y = divalent connecting group; R11 = group having ethylenic double bond; p = 20-80 mol%; q = 20-80 mol%). Preferably, the ink-receiving layers contain fine particles, water-soluble resins, and mordants.

AB Disclosed is the ink-jet recording sheet having an ink-receiving layer on one side of a support, wherein the ink-receiving layer contains a microparticle such as silica, a polyamine compound, and  $\geq 2$  types of cationic polymers. At least one of the cationic polymers is polydiallylamine derivative. At least one of the cationic polymers is represented by  $[H_2C-CR\{A-(CH_2)_m-N+R_1R_2R_3 X-\}]$  ( $R = H, C1-4$  alkyl;  $R1-3 = H, alkyl$ ;  $A =$  divalent bonding group;  $X- =$  anionic group; and  $m =$  integer 1-8). The ink-receiving layer is crosslinked by a crosslinker such as a boric acid.

AB Ink jet recording **sheets** with excellent image stability comprise a **colorant** receiving layer on a substrate, the **colorant** receiving layer comprising fine particles, a water soluble resin, and a cationic resin including a unit represented by formula I and II: wherein, R represents a hydrogen atom or a Me group; Y represents a divalent linking group; R<sup>1</sup> represents an optionally substituted aralkyl or aryl group; R<sup>2</sup> and R<sup>3</sup> each independently represents an optionally substituted alkyl, aralkyl or aryl group having 1 to 18 carbon atoms; R<sup>4</sup> represents an optionally substituted alkylene, aralkylene or arylene group; R<sup>5</sup>, R<sup>6</sup> and R<sup>7</sup> each independently represent an optionally substituted alkyl group having 1 to 18 carbon atoms; R<sup>8</sup> represents an optionally substituted alkylene, aralkylene or arylene group; Q is at least one unit provided from a monomer having an ethylenic double bond, and represents a unit having an inorg./organic ratio (I/O value) of less than 1 in the organic conceptional chart; Z is at least one unit provided from an

aromatic group-containing monomer having an ethylenic double bond, and represents

a unit having less than 0.5 of an I/O value; X- represents an anion; m represents 20 to 100% by mole; and n represents 0 to 80% by mol; p represents 20 to 80% by mole; and q represents 20 to 80% by mole.

PRIORITY APPLN. INFO.:			JP 2002-245431	20020826

AB The sheets comprise (A) substrate sheets and (B) pressure-sensitive releasable adhesive layers comprising (b1) adhesives, (b2) inorg. fillers containing 20-50% (based on B) amorphous silica with apparent sp. gr. (JIS K 6220)  $\geq 0.25$  g/mL, (b3) jet ink fixers, and (b4) binders. The sheets show good processability for offset printing or high-speed jet printing and fast ink drying. Thus, paper was coated with Fultite FB 060JC (Me methacrylate-grafted natural rubber), Sumirez Resin 1001 (acrylamide-diallylamine hydrochloride copolymer), JSR 0696 (styrene-butadiene rubber), PVA R 1130 [silyl-modified poly(vinyl alc.)], and Carplex BS 304N (amorphous silica; apparent sp. gr. 0.31 g/mL) to give an adhesive sheet showing good printability in jet printing or off-set printing. The sheet was folded and press laminated to give a confidential postcard, showing good releasability.

PRIORITY APPLN. INFO.:			JP 2002-103572	A 20020405
AB The sheet comprises a water non-absorbing support coated with a porous ink receiving layer containing inorg. particles, a binder and ≥2 kinds of polyvalent metal compound having different water extractability. In the sheet, the ink receiving layer contains inorg. particles, a binder, a compound containing Al atom in a mol. (except Al oxide) and a compound containing Zr atom in a mol. (except Zr oxide). The sheet gives water-resistant images without bronzing and blotting on storage.

AB The present invention relates to an ink jet recording method of forming an image on an ink jet recording sheet that has, on a support, a

colorant-receiving layer which contains at least one inorg. mordant, by using an ink jet recording ink set that comprises, as min. constituent elements thereof, a yellow ink which contains at least one yellow dye, a magenta ink which contains at least one magenta dye and a cyan ink which contains at least one cyan dye, wherein an oxidation potential of the magenta dye and an oxidation potential of the cyan dye are each nobler than 0.8 V (vs SCE).

AB In manufacture of the sheet by coating a solution containing pigment dispersion and a

water-soluble polymer on a support, the pigment dispersion contains a cationic polymer (A), and the dispersion is mixed with the water-soluble polymer solution after the adsorption of A on the pigment is stabilized. In the manufacture, the inorg. particle dispersion is mixed with the water-soluble polymer solution when the pigment average particle size is 150-300 nm. The paper

obtained by the method is also claimed. It shows improved ink absorbency, preventing cracks and coating defects.

AB Provided are a cationic polymer and an inkjet recording **sheet**  
exhibiting a superior printing d. of an image without lowering ink  
receptivity. The cationic polymer is represented by X1X2X3SiYAmBn:  
wherein X1, X2 and X3 are a hydrogen atom, an alkyl group, an alkoxy  
group, or an aryloxy group; R1 is a hydrogen atom or an alkyl group having  
1 to 4 carbon atoms; R2, R3 and R4 are a hydrogen atom, or an alkyl group

having 1 to 18 carbon atoms, an aryl group or an aralkyl group; Z: -O- or -NH-; Y2 is a bivalent linking group having 1 to 8 carbon atoms, which may have therein a linking heteroatom; A is a quaternary ammonium group-containing acrylate monomer; B is a copolymerizable monomer. The inkjet recording sheet has, on a substrate, a colorant-accepting layer containing cationic polymer modified inorg. pigment particles. A cationic polymer was prepared by telomerization of 3-Mercaptopropyltrimethoxysilane and N-[2-(methacryloyloxy)ethyl]-N,N,N-trimethylammonium chloride.

AB The paper, having Stoeckigt size (JIS P 8112) 5-30 s, comprises (A) 70-95 cationic ink-fixing agent and (B) 5-30 weight% (based on the total solid component) binder. In the paper, the ink fixing agent is a copolymer of 50-100 (meth)acrylic acid ester H <sub>2</sub> C:CR(CO <sub>2</sub> R <sub>1</sub> ) (R = H, Me; R <sub>1</sub> = Me, Et), and 0-15 mol% polymerizable nonionic vinyl monomer, to which cationic				

property is added, and the binder is a poly(vinyl alc.) with 80-90 % saponification degree. The paper shows paper-like feeling, gives high d. images

without bleeding, and water resistance.

AB An ink jet recording sheet comprises a non-water absorptive support having  
thereon an ink absorptive layer comprising polyvinyl alc., a cationic

polymer, and a compound containing a zirconium or aluminum atom other than zirconium oxide and aluminum oxide, wherein a surface pH of the ink absorptive layer is 4 to 6 measured 30 min after receiving a water based ink of pH range 6 to 9 jetted from an ink jet printer in an amount of 20 mL/m<sup>2</sup>. Thus, a photog. base paper coated with low d. polyethylene was coated with a coating composition comprising PVA 203, PVA 245, a cationic polymer, zirconyl acetate, water, and other additives. The obtained ink jet recording sheet exhibits minimized bleeding, and excellent ink absorability and color d. stability under high humidity.

AB The invention relates to a pretreatment solution applied on a recording paper prior to printing, wherein the pretreatment solution contains 10-80 % of an ionic compound decreasing dispersity or viscosity of ink and has 10-10,000 mPa·s viscosity. The pretreatment solution provides the good ink-jet printability and is suitable for use in printing on both sides of a recording sheet.

AB The paper comprises a support having thereon an ink receiving layer containing  
 a compound with a substructure comprising a phenolic OH and -SR (R = H,

aliphatic or aromatic group) in a mol. It is manufactured by coating an aqueous solution containing fine oil droplets containing the above compound It shows improved image

storage stability, ink absorbency, and gloss, preventing blotting.

AB The sheet has an ink absorbing layer containing a hydrophilic binder and cationic composite particles comprising inorg. particles with primary average particle size  $\leq 30$  nm and water-soluble cationic polymer I (R, R' = H, C1-4 alkyl; R1-3, R1'-3' = alkyl; A, J = divalent linkage; X1-, X2- = anion; Q = repeating unit derived from monomer having ethylenic unsatd. bond; x = 10-95, y = 5-90, z = 0-60 mol%; m = 1-6) with average mol. weight  $\leq 100,000$ . The sheet shows good lightfastness and gives images without blotting.

AB The title recording medium contains an amphoteric polymer comprising  $\geq 1$  cationic unit selected from allylamine-type units  $\text{CH}_2\text{CH}(\text{CH}_2\text{NR}_1\text{R}_2)$ , I-IV ( $\text{R}_1, \text{R}_2 = \text{H, Me, Et, cyclohexyl}$ ;  $\text{R}_3\text{-R}_5 = \text{H, Me, Et, benzyl}$ ;  $\text{X} = \text{anion}$ ), and their inorg. or org acid salts and  $\geq 1$  anionic unit selected from  $\text{CH}(\text{CO}_2\text{Y})\text{CR}_6(\text{CO}_2\text{Y})$ ,  $\text{CH}(\text{CO}_2\text{Y})\text{CH}(\text{CO}_2\text{Y})$ ,  $\text{CH}_2\text{C}(\text{CO}_2\text{Y})_2$ , and  $\text{CH}_2\text{C}(\text{CO}_2\text{Y})(\text{CH}_2\text{CO}_2\text{Y})$  ( $\text{R}_6 = \text{H, Me}$ ;  $\text{Y} = \text{H, Na, K, NH}_4, 1/2\text{Ca, } 1/2\text{Mg, } 1/2\text{Fe, } 1/3\text{Al, } 1/3\text{Fe}$ ). The medium may addnl. contain  $\geq 1$  selected from nonionic, cationic, and anionic polymers and amphoteric polymers other than the above polymer. An ink-jet recording method using the medium and dye-containing aqueous inks is also claimed. The medium provides high-quality images with good water resistance and lightfastness by using aqueous inks.

AB The title agents are H2O-soluble acrylonitrile (AN) copolymers with quaternary compds. (CH2:CR1COZZ1)R2R3R4N+ X- or (CH2:CR5CH2)(CH2:CR6CH2)R7R8N+ X- (Z = O, NH; Z1 = ethylene, propylene; R1 = H, Me; R2, R3, R5-R8 = Me, Et; R4 = H, Me, Et, Bz; X- = anion). Thus, 2 mol.% AN and 98 mol.% CH2:CHCO2CH2CH2N+Me3Cl- were polymerized in the presence of 2,2'-azobis(amidinopropane)-2HCl, NaHSO4, and 2-mercaptoethanol to obtain a polymer with intrinsic viscosity 1.2 dL/g in 1 N aqueous NaCl at 25°. A dispersion comprising poly(vinyl alc.) 45, the above polymer 5, powdered SiO2, Zeosil 1100V 50 and H2O 400 g was applied on paper, which gave H2O- and light-resistant printing images.

AB The title recording sheet, which is printed with a H2O-soluble dye-containing ink

by using an ink-jet printer, comprises a cationic polymer and a cationic surfactant applied on a support or impregnated in a support. Preferably, the polymer contains a tertiary amine and/or quaternary ammonium salt, and the surfactant may be an alkylamine or a quaternary ammonium salt of oxyethylene-containing amine. This recording sheet shows excellent color d. and H2O resistance and reduced color smearing.
